

# 2023 United States CISO Priorities Flashcard

Despite the recession, cybersecurity leaders will invest in automation for improving efficiency and effectiveness, rather than reducing costs.

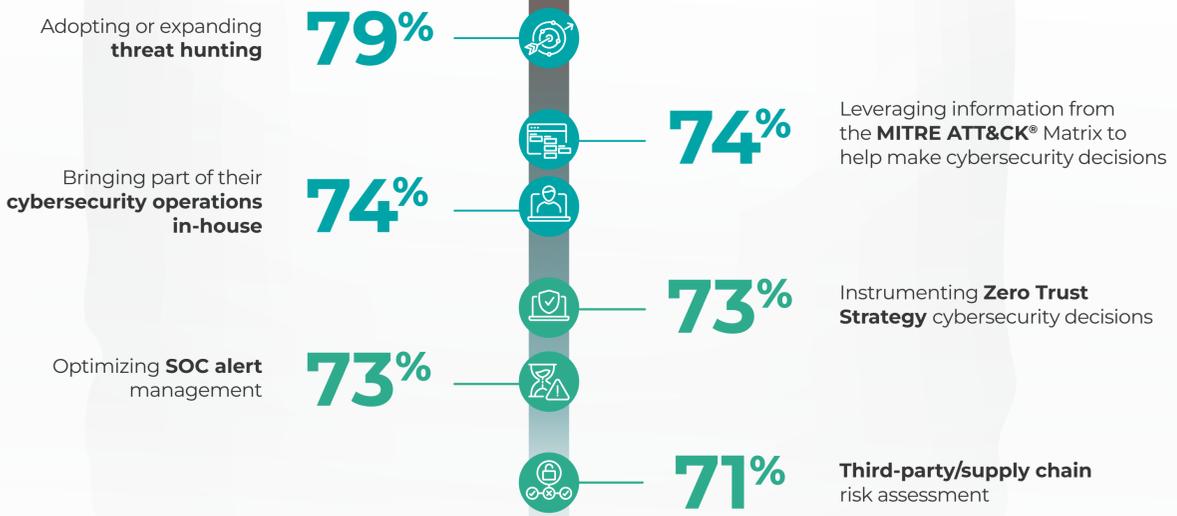

## Top Priorities

## High-Priority Projects

## Emerging Priorities

## Lumu's Take

In 2023, American cybersecurity professionals don't have any 'minor' priorities. It's clear that **every layer of defense is an important part** of a holistic cybersecurity strategy.

With so many areas to focus on, cybersecurity leaders are **investing in increased efficiencies rather than reducing costs**. They will pay greater attention to **addressing the most pertinent risks facing their organization**.

Leaders will continue to focus on **strategically managing vulnerabilities**, an admission that all existing known and unknown vulnerabilities are too numerous to address.

Automation will play a greater role in the year to come, as CISOs seek to harness new technologies—including AI and machine learning—to **increase the efficiency and effectiveness** of their existing cybersecurity talent.

Cybersecurity leaders will seek to integrate the varied components of their cybersecurity stack and **avoid siloed tools** that amount to pain points for their SOC teams. **Unified threat visibility** will be the key to identifying the most immediate threats as well as strategic risks to be addressed.
